

Green Policy

Environmental protection has always been considered a primary issue for Italfim SpA.

The commitment of Italfim SpA are:

- protect the integrity of the environment around our production site and within our production site, making it perfectly integrated with the external community;
- ensure compliance with the laws relating to the environment and safety with continuous and rigorous monitoring;
- identify the significant environmental aspects of its activities, evaluate the impacts on the environment and keep them under control;
- ensure a healthy and safe working environment for all workers;
- continuously improve environmental performance to prevent or reduce pollution;
- minimize the production of polluting substances according to criteria of feasibility and economic sustainability.

To achieve, maintain and improve the results achieved on these objectives Italfim Spa is committed to continuous, systematic and decisive actions, in particular:

- We are equipped with 5 photovoltaic systems with a total power of about 3 MW, which cover 100% of our energy needs and which avoid the emission into the environment of about 900 tons of CO₂ per year.

- We constantly monitor the 3 atmospheric emission points present in the company with analytical sampling (even for the emission points that are not subject by law to periodic analyses). Over the years the results of the tests have always shown concentration values much lower than the limits set by the law in terms of emissions into the atmosphere.
- We periodically sample the air outside our production plants in order to monitor the quality of the air around us.
- We monitor noise levels both inside and around the site.
- Every year, despite not having any industrial water discharge, we carry out samplings on the surface wastewater taken from the canal that crosses our site. This is an initiative of our Management and in agreement with the Municipality of Pedrengo.
- Whenever possible, we use for our products recycled Raw Materials. As documented by our Suppliers approximately 50% of ferritic and austenitic materials are obtained from recycling waste.
- Our packaging material is 100% eco-friendly. Approximately 30% of the wood for pallets and 45% of box cardboard coming from recycling.
- Our waste deriving from the company production cycle is transferred to selected plants capable of recovering this waste to generate SRM (Secondary Raw Materials), which are then put back on the market. Only 0.1% of the waste produced is sent for disposal instead of recycling.
- We maintain, with training initiatives, a high professionalism of the staff aiming at a global growth of all workers. Each operator, in his role, must consider the Protection of the Environment, Safety and Hygiene at Work as primary issues and as part of his work. Anyone can suggest improvement proposals and Italfim SpA is available for an open and constructive dialogue with each collaborator;
- We are very careful to guarantee and preserve our green areas, despite having a very large production area (about 100,000 square meters).

Italfim obtained the 2022 Ecovadis Bronze medal for the results obtained in sustainability!

Italfim obtained the 2024 Ecovadis Badge for the results obtained in sustainability!

We invest and will always invest, with every possible resource, to preserve the environment, for our Earth and for a sustainable future...
